## (54) SUTURE PROSTHETIC MATERIAL

## (57)Abstract:

PROBLEM TO BE SOLVED: To improve a cutting property by consisting at least part of a suturable material of a film body consisting of in vivo decomposition absorptive stock.

SOLUTION: A film body 3 consisting of the in vivo decomposition absorptive stock and a power net fabric 4 are subjected to coarse chain stitching 5, 6 at both selvages and the ends 7, 7 of sewing threads are extended. The constitution obtd. by converging and integrating the front ends of the film body 3 and the power net fabric 4 by sewing and providing one of the thread ends with knots and the center of the film body 3 with a notch is equally preferable. Polyglycolic acid, polylactic acid, copolymer of both, etc., are usable for the in vivo decomposition absorptive stock. The power net fabric 4 is preferably the fabric which is formed by twill knitting and twill weaving rubber yarn, etc., into the textile weave, and has stretchability in longitudinal and transverses; for example, the fabric formed by knitting the yarn formed by covering polyurethane yarn with nylon yarn to a warp knit weave. The resistance value to cutting is lower and the cutting property is improved by such constitution.

## LEGAL STATUS

[Date of request for examination] 01.04.1999

[Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]
